## System characteristics

### Redefining performance

The compact and intelligent Power Panels PP15, PP21, PP35 and PP41 are the first choice for automation on small to mid-size machines and systems with maximum component density. These products integrate the visualization, a complete PLC, and digital inputs and outputs. In addition, these devices can be modularly expanded and are available in variations with text display and graphics with up to QVGA resolution.

Even higher demands are met by the Power Panel 45, Power Panel 300 and Power Panel 400 product lines. Their area of use may range from simple operator terminals and visualizations with a standard operating system to complete automation systems with integrated control and drive technology. Whether stand-alone or networked, the possibilities are endless.

Power Panel 300 embedded devices can be used as a terminal in one system or distributed over several operator stations.

Power Panel 400 devices additionally offer all of the functions of a controller, including modular fieldbus interfaces and input systems that range from analog resistive touch screens to various keyboard devices.

## PP15 / PP21 / PP35 / PP41

### Compact control and visualization devices

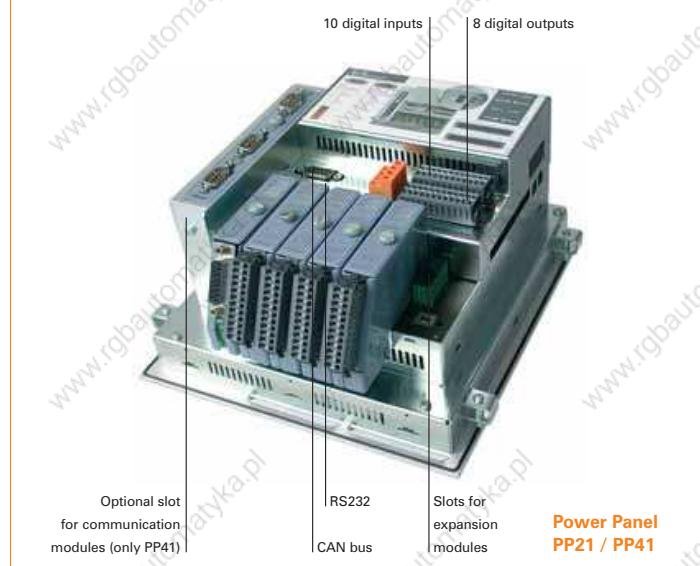

The devices in the Power Panel model range from PP15 to PP41 integrate controller, onboard I/O and visualization. This product family is especially noteworthy for its compact design and extensive range of functions. An integrated CAN bus interface is available for connecting additional input/output channels or drives. Programming applications and the visualization project can be done using Automation Studio, the programming and diagnostics tool from B&R.

### The same aspect ratio for graphics or text

PP15 and PP35 devices offer a choice between a 4 x 20 character or 160 x 80 pixel graphic display with the same outer dimensions.

### Modularly expandable

In addition to the integrated inputs/outputs, the PP21 and PP41 are also equipped with six expansion slots. This enables expansion with up to 60 digital or 24 analog inputs/outputs. Three slots can be used for modules with TPU functionality. As a result, functions such as event counting, trigger function, stepper motor control and frequency measurement are possible. As an additional option, the PP41 offers an expansion slot for System 2005 communication modules. This makes it possible to connect Ethernet TCP/IP in addition to fieldbus systems. Character sets and language modules for the visualization unit are stored on a CompactFlash card that can be exchanged from the outside.

### Power Panel 300 BIOS

#### Universal application

Power Panel 300 devices with BIOS are set up for use with Windows® CE .net or Windows® XP embedded. This allows these devices to be used universally with standard SCADA packages as web terminals or thin clients.

## Power Panel 300 embedded

### More than visualization

Devices in the Power Panel 300 embedded product line are visualization terminals that can be connected to additional Power Panel terminals, industrial PCs, controllers, or any other high-level computer system. However, the Power Panel 300 is more than just a simple display unit. In addition to handling its visualization tasks, the Power Panel 300 can also execute any software component that can run on a controller. Power Panel 100 devices can be programmed with Automation Studio, our extensive configuration and programming tool.

### Distributed or central data storage

The data points are stored either on a central controller (terminal mode) or directly on the Power Panel CompactFlash.

### Open communication

The RS232 and Ethernet interfaces on the Power Panel 300/400 can be programmed as needed. This makes it possible to couple various peripherals or to connect with higher level systems.

## Typical topologies

### Distributed systems

In a distributed system, two or more Power Panel devices are connected to each other over a CAN bus. Control programs run on each Power Panel. The sensors and actuators are connected to the integrated inputs and outputs as well as the remote CAN bus stations.

## Typical topologies

### Power Panel as an intelligent visualization device

The visualization project runs on the Power Panel. Serial RS232 or Ethernet TCP/IP provides the communication to the control. Flexible programming with frame drivers or Ethernet socket services allows a connection to be made to any control system. I/O peripherals and drives are connected to the controller.

## Power Panel 400 with Power Panel 300 terminals

The control program and visualization run on the Power Panel 400. I/O peripherals and drives are connected via a CAN bus, POWERLINK, or another network type. Other Power Panel 300 units are connected as terminals over Ethernet TCP/IP.
